

Northwind Business Intelligence Dashboard

Sales, Customer, and Operational Performance Analysis

Project Description

The Northwind Business Intelligence Dashboard is an interactive reporting solution developed using Microsoft Power BI to analyse sales performance, customer behaviour, product performance, supplier information, and operational activities.

The dashboard consolidates data from multiple business entities into a single reporting platform, allowing decision-makers to monitor key performance indicators (KPIs), identify sales trends, evaluate customer performance, and support strategic business decisions.

The project demonstrates practical Business Intelligence techniques including data transformation, data modelling, DAX calculations, and interactive dashboard design.

Project Objectives

- Analyse overall sales performance.
- Monitor customer purchasing behaviour.
- Evaluate employee sales performance.

Skills Demonstrated

- SQL Database

- Data Cleaning & Transformation

- Data Model

- Dax Measures

Expected Benefits

- Provides a centralised dashboard for monitoring sales, customer, product, and operational performance.
- Reduces the time required to analyse business data by replacing manual spreadsheet analysis with interactive visualisations.
- Enables management to identify sales trends, top-performing products, and customer purchasing patterns more efficiently.
- Supports data-driven decision-making through real-time filtering and dynamic reporting.
- Improves business performance monitoring by presenting key performance indicators (KPIs) in a clear and user-friendly format.
